

Used Forklift Parts

Used Parts for Forklifts - Without doubt, lift truck parts will eventually wear out and require replacing. The alternative of purchasing brand new parts could become pricey so another idea is to purchase used parts. This can save much cash in the end. It is a great idea to obtain used lift truck components that have been reproduced. These parts will guarantee that you are getting components which would work for a long time and be productive.

Remanufacturing broken and worn out parts is a cheaper way overall than rebuilding. With rebuilding parts, only the components which are broken or worn out get replaced, which means that other wearable components may break down soon after acquisition.

Remanufacturing however offers the best assurance for second-hand parts. Remanufactured parts are taken apart and cleaned and then all wearable pieces are replaced. All wearable components are replaced regardless of age or wear which is one more rationale why remanufactured components on the whole run so much better. Whichever part within the part is new and this offers much longer life to the second-hand part. Based on the lift truck parts that are being redone, the cleaning process and the complete remanufacturing process would differ.

After complete disassembly, the engines are oven cleaned. Various parts of the engine such as spark plugs, pistons, rings, valves, valve springs, and filters can be replaced during the remanufacture process. The engines are hot tested after reassembly to ensure that there are no leaks, no noises, no oil pressure problems or any vacuum.

Transmissions are pressure washed, disassembled and oven cleaned. A comprehensive examination is done to be able to check for any cracks. Bushings, seals and bearings are all replaced. Usually, the replacement parts used on transmission components meet OEM specifications.

Some forklift components like torque converters, the alternator, the water pump, the starter and steer axles could be quite serviceable after worn parts are replaced. The electronic control in the electric lift truck is maintained by the control card. This particular card can even be reproduced with replacing all aged and worn out components. Unlike various lift truck parts the control card can only have the worn and aged parts replaced.

Remanufactured parts are meticulously checked upon reassembly to guarantee they are in top condition prior to being sold. It is essential when acquiring reproduced components to be sure they have undergone the proper testing and inspection procedures. On certain larger parts such as transmissions, steer axles and engines, OEM specification replacement parts should be used.

The dealer of used forklifts and components can guarantee that the reproduced parts have met OEM specifications and that these parts meet industry standards. Lots of details go into remanufacturing second-hand components. This attention to detail offers more serviceability out of remanufactured components than the components that were only rebuilt.
